At Oversea Flight Company we take great pride in our young, dynamic team. 1
We are visionaries working every day on the development of an electrical vertical takeoff and landing vehicle that will outlast us! For this demanding
2 task, we are looking for a full-time propulsion engineer as soon as possible.

3 PROPULSION EXPERT (f/m/d)

4 at our Munich Office (Ref. 24112022)

5 **YOUR TASKS:**

- Design of airworthy propulsion system architectures
- Definition of the requirements of the main sub-assemblies, and the establishing of a performance synthesis
- Development of test plans, participation in the test facility development and performance of engine testing
- 6 Close cooperation with other departments like energy distribution, aerodynamics, avionics, and structures as well as safety and certification
- Preparation of Statement of Work documents for collaboration with equipment suppliers
- Ensuring the consistency of the technical processes, methods, and tools in accordance with the company operating framework

YOUR PROFILE:

- Master's degree in Aerospace engineering with hands-on experience in aerospace development 7
- Strong engineering fundamentals in thermo-dynamics, materials, and fluid analysis
- Experience in CAD designing
- Experience in hardware development from concept to working prototypes 8
- High level of target-oriented self-management with the ability to work in a team as well as autonomously
- Fluent in English as working language, skills in German or Spanish are advantageous 9

OUR OFFER:

- Participation in exciting and international projects
- 10 Continuous salary development
- Munich Flight Company Corporate Benefits
- On-the-job training and language courses
- Appreciation, motivation and commitment

We are looking forward to your application. Please go to our online portal and use the "Quick application" button to upload your complete application documents as a PDF.

Analyzing the job ad

Job advertisements are usually structured according to a similar pattern: At the top, you learn something about the company and the advertised position. Then, in three paragraphs, various aspects of the job are covered: The tasks you will be performing, the qualifications required and the general conditions of the job. At the end of the advertisement, the employer often expresses wishes as to the form in which they would like to receive the application.

1 young, dynamic team

Pay attention to the clues between the lines: Here you can learn about the team structure and the work atmosphere. "Young dynamic team" and "demanding task" indicate: These are young people, teamwork is the norm and flexibility is a must. The description does not sound like a quiet job, but it sure can be dynamic and rewarding.

2 full-time

Clarify working conditions: The first paragraph indicates the duration and type of employment: Here, a full-time employee is sought who will presumably be employed for an indefinite period. They are looking for someone who can start as soon as possible.

3 Propulsion Expert

Don't let job titles mislead you: Often you can't deduct from job titles, which tasks and activities are associated with them. This is especially true for young and less established fields and industries. You should therefore always take a close look at the job description to determine whether or not to apply for the role. In this case, the word "expert" does not signify expertise in years, but rather in knowledge. The company requires the candidate to not only undertake engineering activities, but coordinating functions.

4 Munich Office

Note additional information: These details indicate that the company has several offices in different locations. It makes sense to investigate further on the company's homepage: Where is the company's headquarter located? What do the different locations tell me about the company culture?

5 Tasks

Learn about your exact tasks: Are specific activities mentioned *(design of propulsion system, definition of requirements)* or only paraphrases which remain vague on the activities that will fall within your area of responsibility (*close cooperation, ensuring consistency*)? The latter ones would be aspects you could clarify in advance with the recruiter in a phone call or during the job interview.

6 Close cooperation

Think about the actual work: For your application documents a precise analysis of the tasks is often helpful. In order to deomstrate the respective competencies you could, for example, describe a university project in which you have successfully worked together with fellow students.

7 hands-on experience

Do not be scared away by demanding requirements: Practical experience is required in almost every job ad: even those geared toward entry-level employees. Think carefully about where you have gained experience in part-time jobs, internships or student projects that you can contribute here.

8 working prototypes

Share your work: Have you been involved in the development of actual products? For example during your committment in a student initiative or during an internship? In your application documents, aim to provide meaningful examples for all the skills mentioned in the job ad.

9 working language

Improve your German: It is stated that English is the working language, but knowledge of German will be highly valued by the company.

10 Continuous salary development

Pay attention to aspects that are important to you: While this paragraph mentions that the company offers "continuous salary development," this is usually the case with any employer. However, there is no mention of flexible working hours and home office options. If this is important to you, check with the recruiter how these aspects are handled by the company.

11 Address

Reach out: Is there any important information missing that you need for your application? Search for the information by yourself first on the homepage of the company or institution. For individual or personal questions, you can try reaching the recruiter via the phone.
